Reading is important!!

Guide: Getting started with your first bot

Hello! Are you excited to launch your first bot? You are right here!

Before we start, we would like to mention that the functionality of the bot is not fully programmed yet. Currently you can only launch the bot with status updates and basic functionality, but more functionalities could be added in the future.

Before you start, make sure you have JDA Java installed so everything works smoothly.

To start the bot:

Click on the "Discord Bot (Java)" shortcut and all the necessary information will appear. In addition, we added a new feature that allows you to manually stop and restart the bot. Just use the "Start Bot" and "Stop Bot" buttons to control the bot accordingly.

Please note that the buttons make it easier for you to manage the bot and the application runs in the background. You can easily start or stop the bot using the buttons.

Please note that the bot is still a work in progress and more features may be added in the future. Have fun exploring and experimenting with your first bot! If you have any questions or encounter problems, you can always ask for help.

Enjoy your journey into the world of bot development!
